Summary

Software generalist with a deep learning background from Columbia University, blending 0 -> 1 startup experience with scalable engineering. Recently in climate tech, I am now focused on roles with modern AI tools in the loop.

Experience

Tech Lead Manager

Mill

Jan. 2022 - Jan 2025

- **Second software engineer hire at a series C startup with 100m+ in funding**
- **Led a 5-engineer team** in migrating a backend service, originally developed by an external consultancy. **Saved Mill \$900K/year in third-party maintenance fees.**
- **Lead the development and implementation of Mill's climate impact features**, including a mobile app tab, an end-of-year impact summary, and automated monthly user impact emails. The release of these features was **responsible for an 11 point increase in Mill's company wide NPS.**
- Developed an IoT data processing pipeline from device to data warehouse which has **successfully processed over 1 trillion GB of data to date.**
- **Coordinated and developed a three-tier development architecture** covering all aspects of the product lifecycle, from mobile app to website to cloud infrastructure.
- **Designed, built, and maintain a suite of secure factory stations** for device provisioning, ensuring protection against knock-offs, DDOS attacks, and malicious actors connecting to Mill's servers.
- **Designed, built, and maintain a text messaging bot** for field trials, facilitating data collection that **reduced device energy use by 33%** via subsequent algorithm optimization. Implemented temperature compensation for our device's mass system. Performed data analysis and ran lab tests to determine best-effort relationship given a constraints-driven hardware design. Worked cross functionally to incorporate into firmware.
- Fun: created a coffee chats bot that pairs employees for a coffee chat every month. Saves \$400/mo over existing service

Software Engineer

Qualtrics - TextiQ Team

Feb. 2020 - Oct. 2021

- I worked on a team of 5 that owns the backend orchestration service for Qualtrics' text analysis ML models. We process hundreds of millions of text responses daily.
- Developed and owned TextiQ's sentiment enrichment worker, which has tagged hundreds of millions of survey responses with sentiment at ~180 rec/sec.
- Created a data scraper in Python used by the machine learning team to aggregate datasets and train production models.
- Contribute production level code in Scala, React, and Angular in both our frontend and backend services.

Computer Vision/Deep Learning Intern

Kohn Pedersen Fox

June 2019 - October 2020

- Focused on researching experimental ML approaches and productionizing them.
- Developed end-to-end ML pipeline to rapidly and accurately estimate the impact of wind speeds on building design. Used by KPF's sustainability team.
- Fine-tuned a base U-Net architecture to ~94% accuracy per pixel for wind speed estimates.
- Pioneered an error visualization for U-Net model output using image derivatives.

Education

Columbia University

BS in Computer Science

Intelligent System Track

- GPA 3.5/4.0
- Dean's List Fall 2018, Spring 2019
- Jerry and Evelyn Bishop Scholarship recipient
- Relevant coursework: Computer Vision, Advanced Computer Vision, Machine Learning, Natural Language Processing, Advanced Programming

Skills and Abilities

- Languages: Python, Javascript, Scala, C/C++
- Development Libraries: React, Flask, AWS CDK
- ML Libraries: PyTorch, OpenCV, scikit-learn, NumPy, Pandas, matplotlib, Bokeh
- Software Dev tools: Git/Github, Github Actions, Docker
- Cloud Services: I have extensive experience with AWS, Snowflake

Accomplishments

- Work highlighted during KPF presentation at NVIDIA's GTC 2020 GPU Technology Conference
- A December 2020 Employee of the month
- Top 5% of students in Columbia's Computer Vision course.
- One of 4 undergraduates invited to selective, graduate level seminar on Computer Vision (Advanced Computer Vision).
